

CLINIC LAB REPORT

Official Diagnostic Results

Date: 11-May-2026
Lab Provider: Internal Setup

PATIENT NAME

Deepak_test (2026-PT-32)

PRESCRIBING DOCTOR

Deepak

TEST REQUESTED

Complete Blood Count (CBC)

Diagnostic Parameters

Parameter / Test	Result Value	Unit	Ref. Range
Hemoglobin	12	g/dL	13.0 - 17.0
WBC Count	19	cells/mcL	4,500 - 11,000
Platelet Count	15	/mcL	150,000 - 450,000

Doctor/Technician Notes

Interpretation of Complete Blood Count (CBC) Results

This report provides a professional medical interpretation of the provided CBC results.

1. Values Outside Reference Ranges:

- * **Hemoglobin:** 12 g/dL (Reference Range: 13.0 - 17.0 g/dL) - **Low**
- * **WBC Count:** 19 cells/mcL (Reference Range: 4,500 - 11,000 cells/mcL) - **Critically Low**
- * **Platelet Count:** 15 /mcL (Reference Range: 150,000 - 450,000 /mcL) - **Critically Low**

2. Qualitative Summary of Findings:

The CBC results reveal a pattern of severe pancytopenia, characterized by mild anemia, profound leukopenia, and critical thrombocytopenia.

3. Potential Clinical Significance:

- * **Mildly Reduced Hemoglobin (12 g/dL):** This value is suggestive of mild anemia. The specific etiology of the anemia would require further investigation, which could include evaluation for nutritional deficiencies, chronic disease, or underlying hematological issues.
- * **Critically Low WBC Count (19 cells/mcL):** This indicates severe leukopenia. Such a profoundly low white blood cell count suggests significant immune compromise, bone marrow suppression, or failure. This finding portends a substantially increased risk of severe, life-threatening infections and warrants urgent clinical evaluation.
- * **Critically Low Platelet Count (15 /mcL):** This signifies severe thrombocytopenia. Platelet counts at this level are associated with a critically elevated risk of spontaneous bleeding, including severe mucosal, gastrointestinal, or intracranial hemorrhage. Immediate clinical intervention and investigation into the cause are typically indicated.

4. Conclusion:

The combination of mild anemia, critically low WBC count, and critically low platelet count points to a severe hematological derangement requiring prompt medical attention and comprehensive diagnostic work-up.

This is an AI-generated draft for professional review and should be correlated with the patient's clinical presentation, history, and other diagnostic findings by a qualified healthcare professional.
