

CLINIC LAB REPORT

Official Diagnostic Results

Date: 12-May-2026
Lab Provider: Internal Setup

PATIENT NAME

Deepak_test (2026-PT-32)

PRESCRIBING DOCTOR

Deepak

TEST REQUESTED

Complete Blood Count (CBC)

Diagnostic Parameters

Parameter / Test	Result Value	Unit	Ref. Range
Hemoglobin	18	g/dL	13.0 - 17.0
WBC Count	4000	cells/mcL	4,500 - 11,000
Platelet Count	100000	/mcL	150,000 - 450,000

Doctor/Technician Notes

****CBC Results Interpretation****

This is an AI-generated draft for professional review.

****Findings:****

- **Hemoglobin:**** 18 g/dL (Reference Range: 13.0 - 17.0 g/dL) - ****Elevated****
- **WBC Count:**** 4000 cells/mcL (Reference Range: 4,500 - 11,000 cells/mcL) - ****Decreased****
- **Platelet Count:**** 100,000 /mcL (Reference Range: 150,000 - 450,000 /mcL) - ****Decreased****

****Qualitative Summary:****

The complete blood count results demonstrate an elevated hemoglobin level, indicative of erythrocytosis, along with concurrent leukopenia (decreased white blood cell count) and thrombocytopenia (decreased platelet count).

****Potential Clinical Significance:****

The observed elevated hemoglobin (18 g/dL) suggests polycythemia, which warrants further investigation to differentiate between primary and secondary causes. The decreased WBC count (4000 cells/mcL) indicates leukopenia, which could be due to various factors including viral infections, medication effects, autoimmune disorders, or bone marrow suppression. The significantly decreased platelet count (100,000 /mcL) represents thrombocytopenia, suggesting impaired production, increased destruction, or splenic sequestration of platelets. The combination of these findings (pancytopenia with relative erythrocytosis) indicates a need for thorough clinical correlation, detailed patient history, physical examination, and potentially further diagnostic testing to elucidate the underlying etiology.
